Energy is $E = mc^2$ and the ratio is $\varphi = \frac{1+\sqrt{5}}{2}$.

The sample mean is $\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i$ for data $x_1, \ldots, x_n$.

$$\int_0^\infty e^{-x^2}\,dx = \frac{\sqrt{\pi}}{2}$$

Bayes: $p(\theta \mid x) = \frac{p(x \mid \theta)\, p(\theta)}{p(x)}$.

$$\nabla \cdot \mathbf{E} = \frac{\rho}{\varepsilon_0}$$

$\hat{\beta} = (X^T X)^{-1} X^T y$ and $\alpha \leq \beta \neq \gamma$

$$\sum_{k=0}^{n} a_k = 2^n \qquad \prod_{j=1}^{m} a_j \leq \infty$$
